Agenda

01 Importing the Libraries

02 Loading the Data

03 Data Cleaning

04 One Hot Encoding

05 Feature Selection

06 Implementing ML Algorithms

Problem Statement

You are working as a data scientist in a global finance company. Over the years, the company has collected basic bank details and gathered a lot of credit-related information. The management wants to build an intelligent system to segregate the people into credit score brackets to reduce the manual efforts. Given a person's credit-related information, build a machine learning model that can classify the credit score.

Dataset Information

Credit score dataset contains 1 lac records with 28 features.

Dataset Information

Attributes	Description
ID	unique identification of an entry
Customer_ID	unique identification of a person
Month	month of the year
Name	name of a person
Age	age of the person
SSN	social security number of a person
Occupation	occupation of the person
Annual_Income	annual income of the person
Monthly_Inhand_Salary	monthly base salary of a person
Num_Bank_Accounts	number of bank accounts a person holds
Num_Credit_Card	number of other credit cards held by a person

Dataset Information

Attributes	Description
Interest_Rate	interest rate on credit card
Num_of_Loan	number of loans taken from the bank
Type_of_Loan	types of loan taken by a person
Delay_from_due_date	average number of days delayed from the payment date
Num_of_Delayed_Payment	age of the person
Changed_Credit_Limit	percentage change in credit card limit
Num_Credit_Inquiries	number of credit card inquiries
Credit_Mix	classification of the mix of credits
Outstanding_Debt	remaining debt to be paid (in USD)
Credit_Utilization_Ratio	utilization ratio of credit card
Credit_History_Age	the age of credit history of the person

Dataset Information

Attributes	Description
Payment_of_Min_Amount	the minimum amount was paid by the person
Total_EMI_per_month	monthly EMI payments (in USD)
Amount_Invested_monthly	monthly amount invested by the customer (in USD)
Payment_Behaviour	payment behavior of the customer (in USD)
Monthly_Balance	monthly balance amount of the customer (in USD)
Credit_Score	the bracket of credit score

Importing the Libraries

We start off this project by importing all the necessary libraries that will be required for the process.

```
import pandas as pd
import matplotlib.pyplot as plt
import numpy as np
import seaborn as sns
```

Loading the Data

Loading the data and removing unnecessary column from the dataframe

```
df=pd.read_csv("credit_score.csv")
df=df.drop(columns=["ID","Customer_ID","Name","SSN","Type_of_Loan","Credit_History_Age"])
df.head()
```

	Month	Age	Occupation	Annual_Income	Monthly_Inhand_Salary	Num_Bank_Accounts	Num_Credit_Card	Interest_Rate	Num_of_Loan	Delay_from_due_date	...
0	January	23	Scientist	19114.12	1824.843333	3	4	3	4	3	...
1	February	23	Scientist	19114.12	NaN	3	4	3	4	-1	...
2	March	-500	Scientist	19114.12	NaN	3	4	3	4	3	...
3	April	23	Scientist	19114.12	NaN	3	4	3	4	5	...
4	May	23	Scientist	19114.12	1824.843333	3	4	3	4	6	...

5 rows × 22 columns

Loading the Data

Checking the shape of a dataframe and datatypes of all columns along with calculating the statistical data.

```
df.shape
df.info()
df.describe()
```

```
(100000, 22)
```

	Monthly_Inhand_Salary	Num_Bank_Accounts	Num_Credit_Card	Interest_Rate	Delay_from_due_date	Num_Credit_Inquiries

```

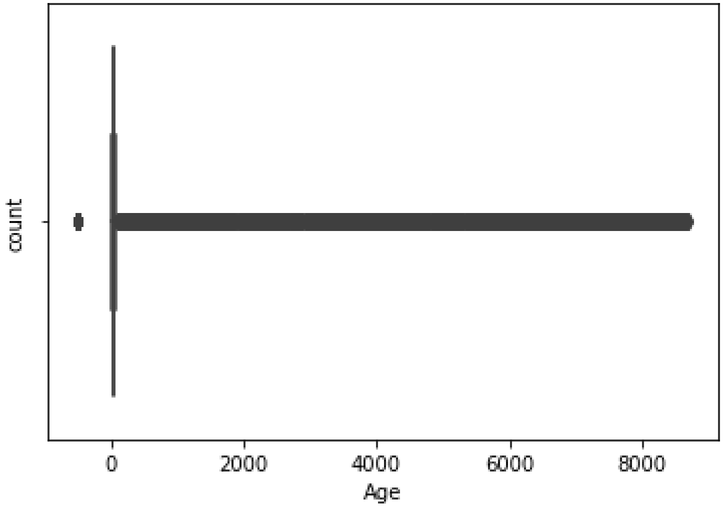
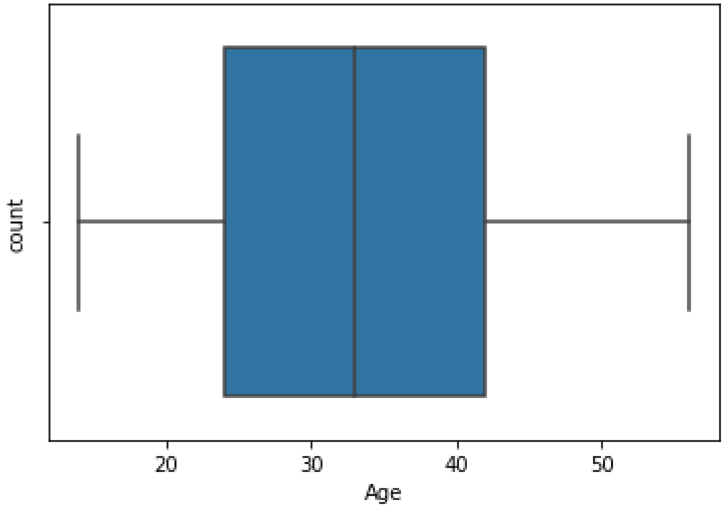
After replacing the special characters with null value. The new missing value is shown in the figure. Here Forward and backward filling method is used to fill the missing values.

Data Cleaning

```
sns.boxplot(df["Age"])
plt.xlabel("Age")
plt.ylabel('count')
plt.show()
```



```
col_names=["Age"]
Q1 = df.Age.quantile(0.25)
Q3 = df.Age.quantile(0.75)
IQR = Q3 - Q1
data = df[(df.Age >= Q1 - 1.5*IQR) & (df.Age <= Q3 + 1.5*IQR)]
sns.boxplot(data["Age"])
plt.xlabel("Age")
plt.ylabel('count')
plt.show()
```



removing outliers from age since all other columns values are relevant

Data Cleaning

```
from sklearn.preprocessing import LabelEncoder
le= LabelEncoder()
df["Month"]=le.fit_transform(df["Month"])
df["Occupation"]=le.fit_transform(df["Occupation"])
df["Payment_Behaviour"]=le.fit_transform(df["Payment_Behaviour"])
df.info()
```

Performing One Hot Encoding for categorical features of a dataframe

```
Column                    Non-Null Count   Dtype
------                    --------------   -----
Month                     100000 non-null  int64
Age                       100000 non-null  int64
Occupation                100000 non-null  int64

             }

grid_obj = GridSearchCV(dt, parameters)
grid_obj = grid_obj.fit(x_train, y_train)
dt = grid_obj.best_estimator_
dt.fit(x_train,y_train)
y_pred = dt.predict(x_test)
acc_dt = round(accuracy_score(y_test, y_pred) * 100, 2 )
print( 'Accuracy of Decision Tree model : ', acc_dt )
```

```
Accuracy of Decision Tree model :  70.93
```

Here, We are using GridSearch CV technique which is used to identify the optimal hyperparameters for a model and the accuracy obtained from Decision Tree is 70.93

Random Forest

The accuracy of the random forest model is 79.7 percentage

```
from sklearn.ensemble import RandomForestClassifier
rfc= RandomForestClassifier()
rfc.fit(x_train,y_train)
y_pred=rfc.predict(x_test)
accuracy_score(y_test,y_pred)
pd.DataFrame({"Actual_Value":y_test,"Predicted_Value":y_pred})
```

```
0.7974
```

	Actual_Value	Predicted_Value
